Abstract

Education and training is an important field that affects and determines the existence and development of society. Education and training social phenomena occur in the process of transferring knowledge and experiences between people through language and other sign systems to inherit and maintain the existence, evolution, and development of humanity. Improving the quality of education and training is an urgent issue in the current educational reform context. Theoretical and practical problems have clarified the essential elements of the quality of education and training. These are qualitative studies that are made based on an overview of assessments and comments from legal documents of the Party and the State of Vietnam and from studies of experts that have contributed to clarifying that it is necessary to improve the quality of education and training in the context of educational innovation. Based on studying the legal documents of the Vietnamese Party and State on education and training, renovating education and training; survey the current status of education and training quality assurance in several educational and training institutions; this study clarifies the context of educational innovation, the difficulties, and challenges posed in the educational innovation process; thereby proposing measures to improve the quality of education in the context of educational reform in Vietnam today.

Keywords: Education and training, ensure the quality, quality improvement of education and training, educational innovation, Vietnam

Introduction

Education is always the national policy of every country in the world (Wentling, 1993; Basso, 2003; Harvey & Newton, 2004; Bach, et al., 2014; Akpan, 2016). The quality of education must always ensure the most basic elements and at the same time always aim to improve the quality of education (Kellogg Foundation, 2000; Quoc, 2013; Thuan & AnLong, 2020). The quality of education must be done regularly, continuously, and non-stop. The improvement of the quality of education involves many different factors.

The quality of education is the number one issue of the educational career (Vincenzi, et al., 2018; DangNguyen & Son, 2020). Currently, in our country, a lot of people are interested in quality and have many different conceptions, some of which have a more or less negative impact on the entire management of education and training such as quality assessment. the quality of education arbitrarily without basis, attributing the quality of education to the results of the exams, etc. Therefore, it is very necessary to clarify the concept of education quality and its evaluation criteria, and on that basis offer effective solutions to improve the quality of education at all levels of study, and grade levels.

For many years, the Party and the State of Vietnam have always considered education as the top national policy (Communist Party of Vietnam, 1998, 2011, 2016 & 2021). Vietnam has spent a lot of resources prioritizing investment in education development. The policies focus on comprehensively reforming education, in which attention is paid to teachers' development, especially in the remote, border, and island areas

(Ministry of Education and Training, 2018a & 2018b). Despite facing many difficulties, the education and training sector has made great contributions to fostering moral character for the young generation, helping to develop human beings, raising people's intellectual level, and training human resources, making a common contribution to the country's socio-economic development, so that our country can have the opportunity, potential, position, and prestige as it is today (Communist Party of Vietnam, 2016 & 2021a).

In recent years, education in Vietnam has achieved more positive results, affirming its essential position, although there is still a lot of work to be done and reformed in the future (Party Central Committee, 2013; Communist Party of Vietnam, 2016 & 2021a). The quality of education is increasingly being improved at all levels of education. Several universities have improved their positions in regional and international rankings. Vietnamese students have won many high prizes in international and regional Olympic competitions, demonstrating the wisdom and creativity of the Vietnamese people. These achievements have been greatly contributed by the team of teachers.

Currently, Vietnam is drastically implementing solutions to radically and comprehensively renew education and training to improve the quality of education at all levels (Communist Party of Vietnam, 2013). The motto is: Taking learners as the center, focusing on developing students' moral personality and creativity. To do so, we need to continue to use the school as the foundation and the teacher as the motivation to successfully implement the student-centered motto (DangNguyen & Son, 2022). In that process, the requirement is to learn real, take real exams, and have real talent.

With the requirements placed on education and training in Vietnam, it is necessary to improve the quality of education and training through quality assurance activities in education and training (DangNguyen & Thuan, 2020; DangNguyen & Son, 2022). Education and training quality assurance activities pose many requirements for education and training such as Increasing investment in facilities and equipment for education and training activities (Cullen, 2003; Hang & Van, 2020; Duchiep, et al., 2020); building and developing a team of teachers and staff (Van, 2022c & 2022d)); increasing investment in education cooperation (Duchiep, et al., 2022; Vuhong, 2022a & 2022b); links between schools and businesses, etc.

With these requirements in mind, this study focuses on analyzing the state of quality assurance of education and training in several educational and training institutions; clarifies the context of educational innovation, difficulties, and challenges posed in the process of educational innovation; thereby proposing measures to improve the quality of education in the context of educational innovation in Vietnam today.

Literature Review

Quality of education

The quality of education has always been a matter of great concern to society because of its importance to the development of the country in general and education in particular. In education, educational activities are closely related to each other to form a closed circle.

According to Clause 1, Article 2 of Circular 61/2012/TT-BGDDT stipulating conditions for establishment and dissolution, tasks and powers of education accrediting organizations, appointed by the Minister of Education and Training promulgated: "Education quality is the fulfillment of the objectives of an educational institution or educational program, and the requirements of the Law on Education, the Law amending and supplementing several articles of the Law on Education and the Law on Higher Education, suitable to the needs of using human resources for the socio-economic development of the locality and the whole country".

According to the provisions of Article 2 of Circular 18/2018/TT-BGDDT on quality accreditation and recognition of national standards for middle and high schools, "the quality of secondary school education is the fulfillment of the secondary school's goals. education, ensuring the requirements on educational objectives of the Education Law, in line with the socio-economic development of the locality and the whole country".

With the above points of view, it can be understood that the quality of education is the fulfillment and assurance of the educational requirements of each different school to ensure the requirements of the Education Law and the development of society. Education quality will have an education quality accreditation process and a standard accreditation process for secondary schools, which is carried out according to the following steps: Self-assessment=> External assessment=> Acknowledge the school (university) as having achieved educational quality accreditation and recognize the school meets national standards.

Thus, all activities have quality, the output will have quality. The quality of education is reflected in the quality of all educational activities, which is the quality of the input, the quality of the process, and the quality of the output placed in a specific

context. The quality of education is reflected in the level of achievement of learners in terms of knowledge, skills, and attitudes; the ability to adapt to a new environment, and the ability to find a job position in the future. Therefore, the quality of education is the conformity of students' abilities with the output standards of an educational process or program.

Assurance of education quality

From the perspective of quality assurance in economic management, quality assurance in education can be understood as a form of quality management implemented before and during education. Quality assurance aims to prevent the occurrence of errors in the educational process to avoid creating "educational products" of low quality. The Vietnam standard defines: Quality assurance as all planned and systematic activities carried out within a quality system and demonstrated to be necessary to provide adequate confidence that the entity (object) will fully satisfy the quality requirements (Quoc, 2013). Quality assurance is the means of making a product free from defects caused by errors in the production or education process so that quality is entrusted to each person involved in the production or education process (Pham, 2018). From this idea, people are interested in creating a system of quality standards when applying the quality assurance model so that those who directly make the product must be aware of the importance of quality, know how to achieve higher quality, and desire to do it yourself, moreover, entice and motivate others to do as well as them or do better than themselves.

Thus, education quality assurance is a system of measures and planned activities carried out inside and outside the school that has been demonstrated to be sufficient to provide adequate confidence that the activities and products (students) will fully satisfy the requirements of educational qualification according to the output standards of the educational program.

Training quality assurance includes internal quality assurance and external quality assurance. Internal quality assurance is undertaken by the school, external quality assurance is carried out by authorities outside the school (including quality accreditation agencies). Ensuring quality inside the school is the most important factor, the school actively creates quality (Duchiep, et al., 2022; DangNguyen & Son, 2022).

The context of educational innovation

The context of the world:

The world is in the early years of the third decade of the 21st century with strong developments, which have a significant impact on the socio-economic development of Vietnam in general as well as the educational development of the country. Some important factors that can affect education in Vietnam can be pointed out below:

First of all, it is the process of globalization and international integration going on very strongly. The impact of globalization requires countries to promote the development of their education. Because, to deepen international integration, countries need to build human resources with the necessary knowledge, skills, and qualities (Communist Party of Vietnam, 2013, 2016 & 2021a). Therefore, globalization in education is also a challenge for each country, requiring radical and comprehensive innovation.

Second, the scientific and technological revolution is taking place strongly (the Fourth Industrial Revolution) which is forecasted to change all aspects of society, including education. Therefore, this revolution will also change the way labor is in the field of education.

Third, the formation of a knowledge economy and a knowledge society; in which, knowledge plays a decisive role in all areas of social life. The formation of a knowledge economy requires education to go beyond traditional frameworks and constantly innovate and adapt.

The context of domestic:

After 36 years of innovation (starting in 1986), Vietnam's education has achieved many achievements in improving the quality of human resources, promoting the human factor to promote the development of the country (Communist Party of Vietnam, 2016 & 2021a). However, besides the achievements, the quality and effectiveness of education and training are still low compared to the requirements, especially in higher education and vocational education; the education and training system lacks the connection between levels and between education and training modes, still heavy on theory and light on practice; training is not linked with scientific research, production, business and the needs of the labor market; not paying due attention to ethics education, lifestyle and working skills; educational methods, examination, examination and assessment of learning results are still outdated; education and training management is still weak; teachers and educational administrators are inadequate in terms of quality, quantity, and structure; a part has not kept up with the requirements of educational innovation and development, lacks enthusiasm, even violates professional ethics (Party Central Committee, 2013).

Resolution No. 29-NQ/TW of the Central Committee of the Communist Party of Vietnam (2013) gave direction, goals, tasks, and solutions to orient the development of education in the new period. A comprehensive and synchronous solution system is offered, including the following issues:

Strengthening the leadership of the Party and the management of the State over education and training innovation;

Continue to strongly and synchronously renew basic elements of education and training in the direction of developing learners' qualities and capacities;

To fundamentally renovate the form and method of examination, examination, and evaluation of education and training results, ensuring honesty and objectivity;

Completing the national education system according to an open education system, lifelong learning, and building a learning society;

To fundamentally renovate the management of education and training, to ensure democracy and unity, to increase the autonomy and social responsibility of education and training institutions; attach importance to quality management;

Developing a contingent of teachers and administrators, meeting the requirements of education and training innovation;

Innovating financial policies and mechanisms, mobilizing the participation and contributions of the whole society, improving investment efficiency for education and training development;

Improve the quality and efficiency of research and application of science and technology, especially educational science and management science;

Actively integrate and improve the effectiveness of international cooperation in education and training.

These are major orientations and are being actively implemented by all levels and sectors to create fundamental and comprehensive changes in education in Vietnam today. Since then, the Ministry of Education and Training has proposed many policies to fundamentally and comprehensively renew education, meet new requirements, and overcome the limitations of current Vietnamese education.

Methodology

Theoretical research methods

Theoretical analysis and synthesis: This method is used to analyze, synthesize, and systematize scientific information collected from documents related to the research problem, viewpoints, and theories on assurance. quality assurance of education and training in the context of educational innovation. From there, draw conclusions related to the research problem. This research method aims to understand theoretical issues related to education and training quality assurance activities in the context of educational innovation to build the theory of the topic and collect Scientific information on the history of education quality assurance research and training in the context of educational innovation.

Collect documents, and documents related to the research problem. Synthesize, analyze, and research textbooks, books, and publications such as theses, theses, topics, and scientific reports related to science on activities of ensuring the quality of education and training created in the context of educational innovation to build a theoretical basis for the research topic. Classification and systematization of related theoretical bases. Based on theory, hypothesize, and orientation for research.

Questionnaire survey method

The purpose of the investigation: The research team used the survey method by questionnaire to collect data and data on education and training quality assurance activities in the context of educational innovation, and identify difficulties and challenges posed in the current educational reform process in Vietnam.

Survey content: Collecting information on the actual status of education and training quality assurance activities in the context of educational innovation. We also used the questionnaire to investigate the necessity and feasibility of measures to improve education quality in the context of educational innovation.

Participants: This study has the participation of 572 people (N=572), who are in the field of state management of education, teachers, and lecturers who are teaching at some institution's education and training.

Questionnaire design: The questionnaire is designed related to education and training quality assurance activities in the context of educational innovation. Questions about gender, age, education level, seniority, and working position were added to the questionnaire (table 1).

Variables	Characteristic	Frequency	Percent
Gender of surveyed person	Female	281	49.13
	Male	291	50.87
Age of the people surveyed	25-30 years old	117	20.45
	31-40 years old	163	28.50
	41-50 years old	170	29.72
	51-62 years old	122	21.33
Degree of the person being surveyed	Bachelor	166	29.02
	Master	151	26.40
	Doctor	147	25.70
	Associate Professor and Professor	108	18.88
Working years of the surveyed person	Less than 5 years	73	12.76
	5-10 years	104	18.18
	11-20 years	297	51.92
	21-30 years	98	17.13
Working position	School teacher ((junior, high school)	171	29.90
	University lecturer	322	56.29
	School administrators (junior, high school)	30	5.24
	University administrators	49	8.57

Table 1. Survey participants
(Source of the author's survey. N=572)

Research Results and Discussion

Assess the importance of education and training quality assurance activities in the context of educational innovation

To assess the importance of education and training quality assurance activities in the context of educational innovation, the research team surveyed N=572 people with 05 rating levels: Not important; Less important; Rather important; Important; Very important. The results are shown in figure 1.

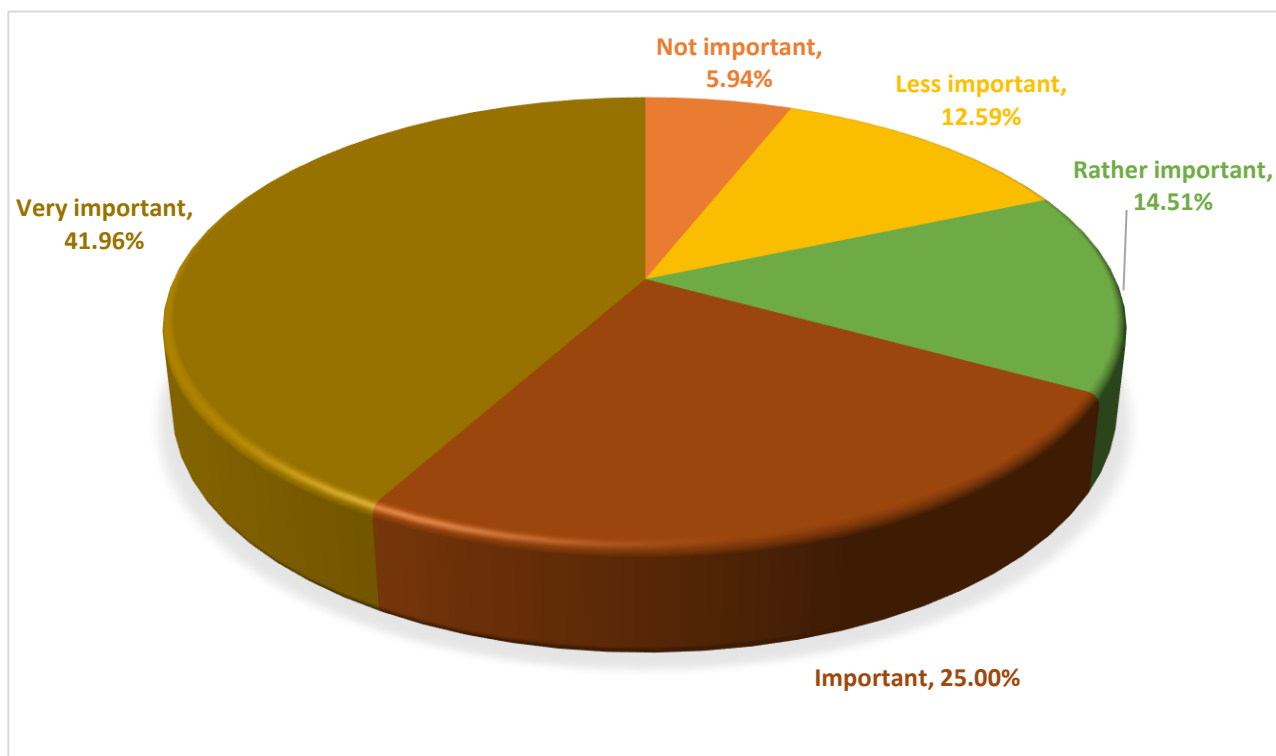

Fig 1. Assess the importance of education and training quality assurance activities in the context of educational innovation
(Source of the author's survey. N=572)

The survey results showed that the number of people who rated "Very important" accounted for 41.96%, and "Important" was 25.00%. Thus, the total number of "Important" and "Very important" evaluations accounted for 66.96% of the total number of respondents. The number of people who rated it as "Not important" accounted for 5.94%, and "Less important" accounted for 12.59%; 14.51% of respondents are "quite important".

The results of this survey indicated that quality assurance activities in education and training institutions have been interesting in recent years, reflected in a higher rate of "Important" and "Very important" evaluations compared with other ratings. This is also consistent with the current general trend of education in the context that Vietnam is constantly innovating education. However, there are still ratings that are "Less important" and "Not important"; some assessments are "Rather important", and there are still things that are not well understood about education and training quality assurance activities in the current new context. This problem shows that it is necessary to take measures to raise people's awareness about the quality assurance activities of education and training

in educational institutions in Vietnam in the coming time.

To better understand the assessment of the importance of education and training quality assurance activities in the context of educational innovation, the research team has divided the survey subjects into different groups specific improvement: Assess the importance of education and training quality assurance activities in the context of educational innovation according to the gender of surveyed person (figure 2); Assess the importance of education and training quality assurance activities in the context of educational innovation according to the degree of the person being surveyed (figure 3); Assess the importance of education and training quality assurance activities in the context of educational innovation according to the age of the people surveyed (figure 4); Assess the importance of education and training quality assurance activities in the context of educational innovation according to the working years of the surveyed person (figure 5); Assess the importance of education and training quality assurance activities in the context of educational innovation according to the working position (figure 6).

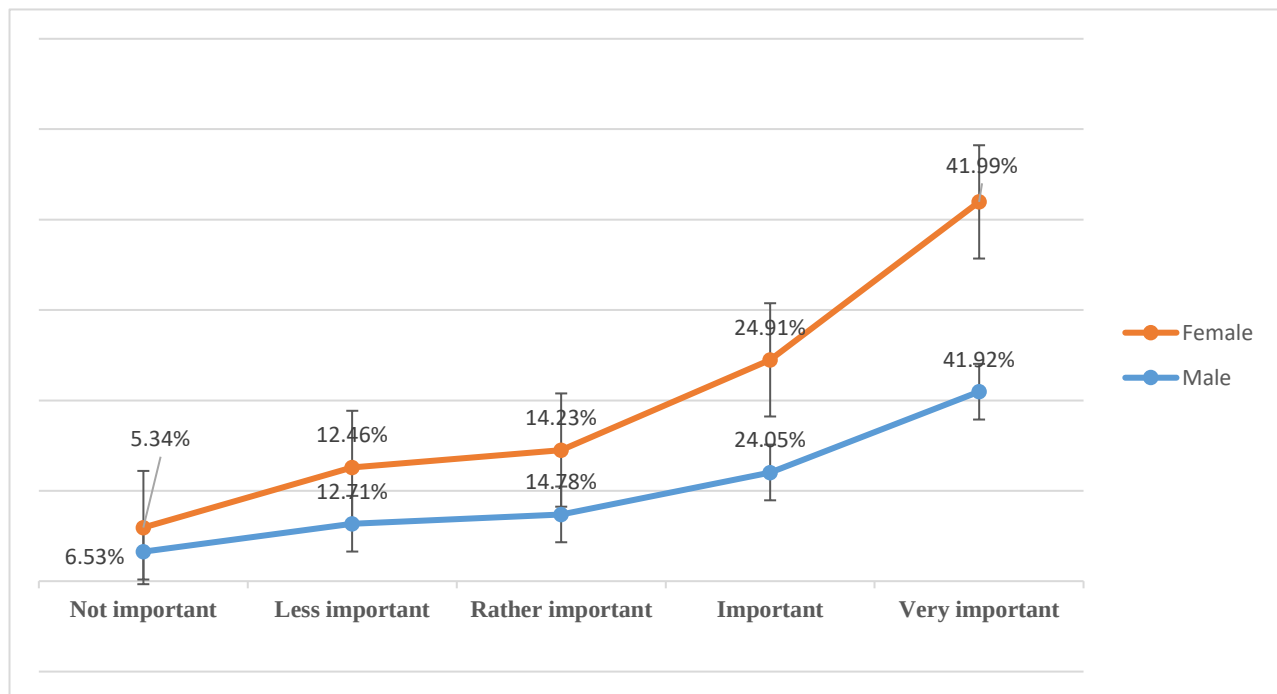

Fig 2. Assess the importance of education and training quality assurance activities in the context of educational innovation according to the gender of surveyed person
(Source of the author's survey. N=572)

Assessing the importance of education and training quality assurance activities in the context of educational innovation according to the gender of promising person showed that: assessment at the level of "Very important" accounted for the

highest proportion, specifically: men accounted for 41.92%, women accounted for 41.99%. However, the number of men and women rated "Not important", and "Less important" was almost the same.

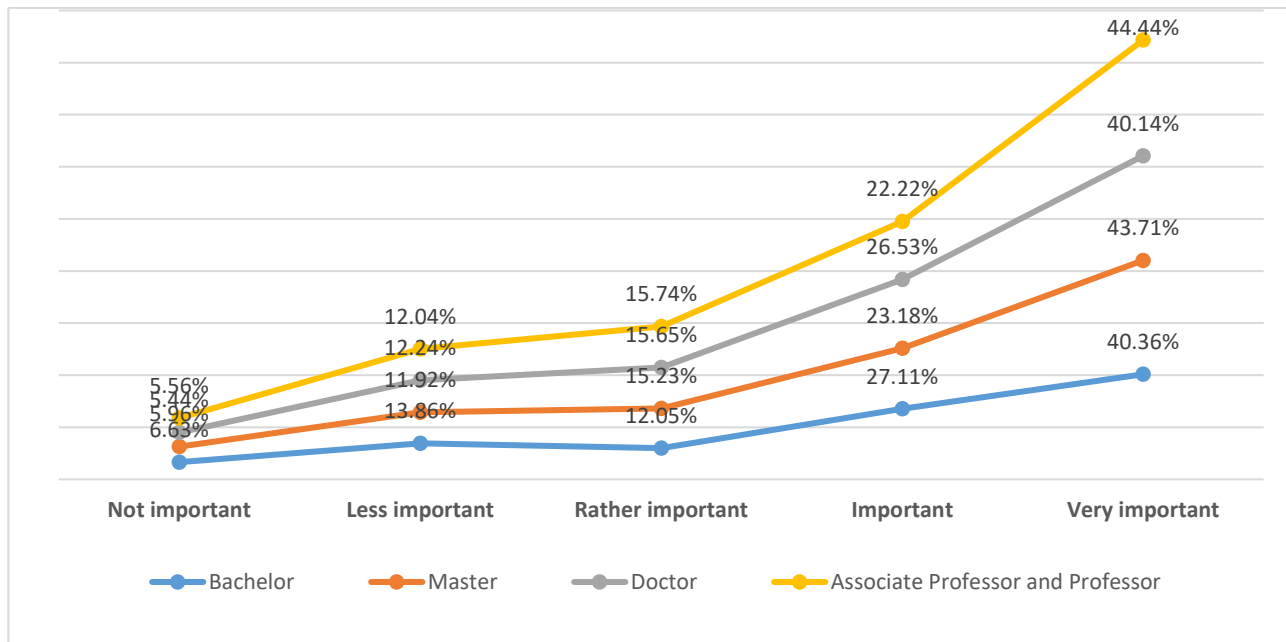

Fig 3. Assess the importance of education and training quality assurance activities in the context of educational innovation according to the degree of the person being surveyed
(Source of the author's survey. N=572)

Assessing the importance of education and training quality assurance activities in the context of educational innovation according to the degree of the person being surveyed showed that: "Very important" and "Important" still account for the highest percentage. However, based on qualifications, the assessment

is not uniform. Specifically, for people with the rank of professor and associate professor, the rating "Very important" accounted for 44.44%, accounting for the highest rate. Meanwhile, for people with a doctorate degree, the rating "Very important" accounts for 40.41%.

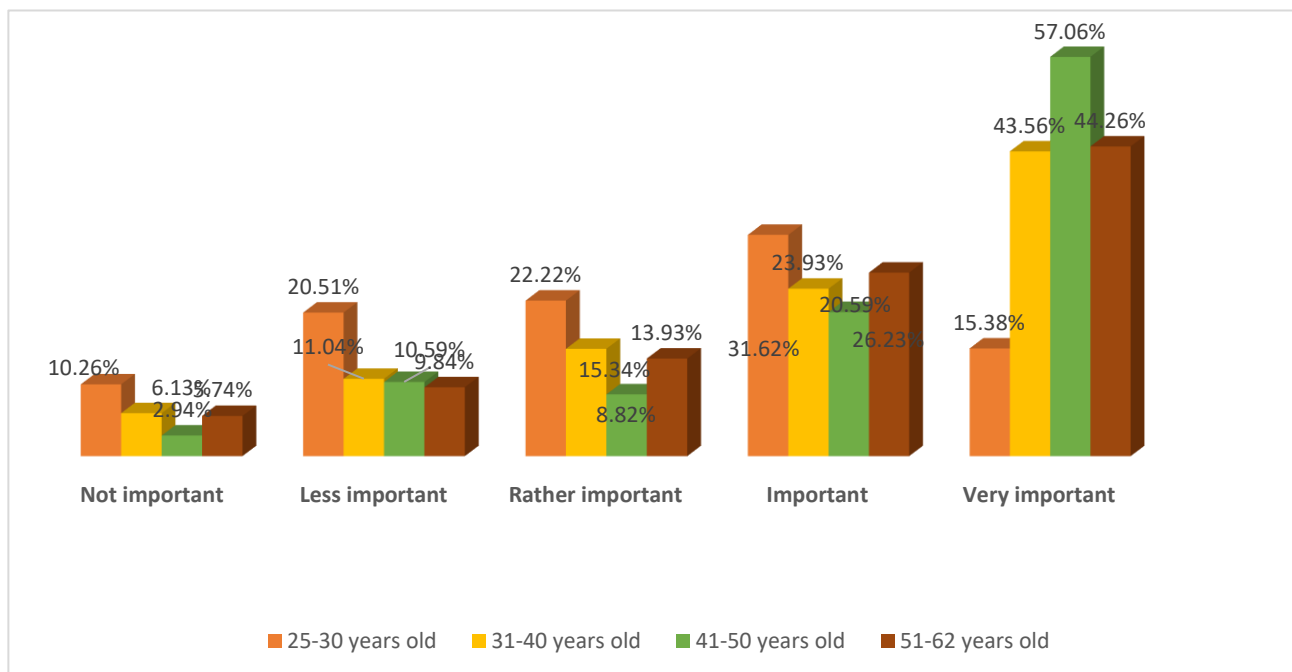

Fig 4. Assess the importance of education and training quality assurance activities in the context of educational innovation according to the age of the people surveyed
(Source of the author's survey. N=572)

Assessing the importance of education and training quality assurance activities in the context of educational innovation according to the age of the people surveyed showed that: The

"Very important" and "Important" ratings are the highest. Which, the age group from 41-50 years old rated "very important" accounted for the highest rate of 57.06%; Meanwhile, the age

GENERAL MANAGEMENT

group from 25-30 years old rated "Very important" accounted for the lowest rate of 15.38%.

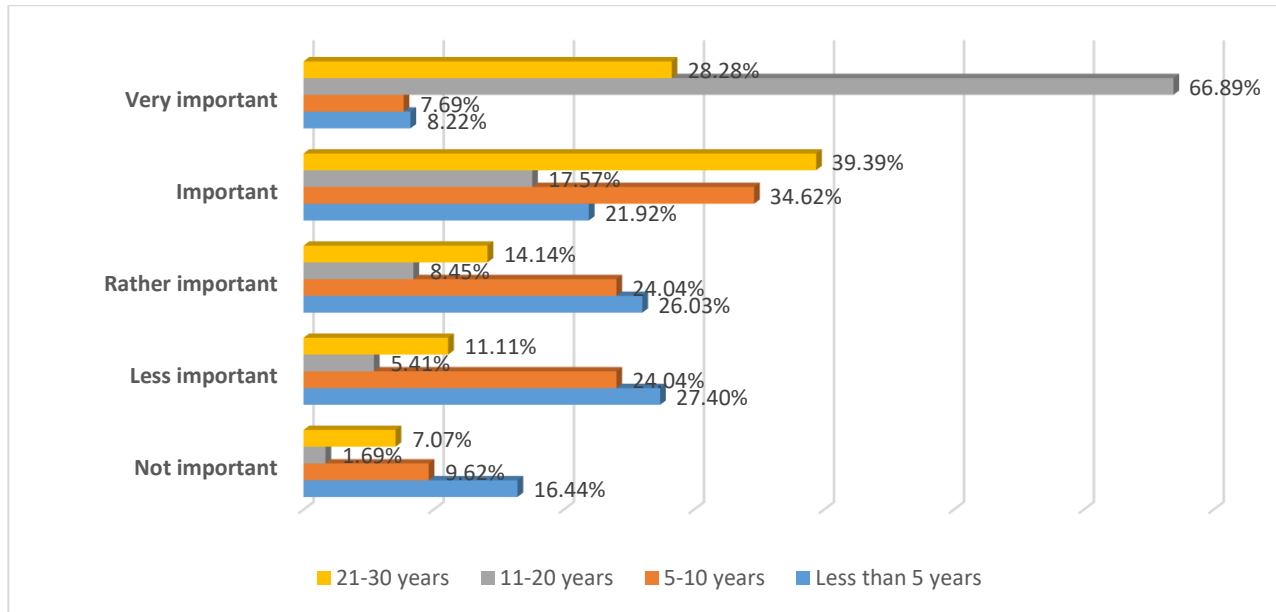

Fig 5. Assess the importance of education and training quality assurance activities in the context of educational innovation according to the working years of the surveyed person
(Source of the author's survey. N=572)

Assessing the importance of education and training quality assurance activities in the context of educational innovation according to the working years of the surveyed person showed that: Working years from 11-20 years of assessment "Very

important" accounted for the highest percentage of 66.89 %, working years from 21-30 years, the highest "important" rating is 39.39%. In that case, years of working under 5 years rated "Not important" as the highest, accounting for 16.14%.

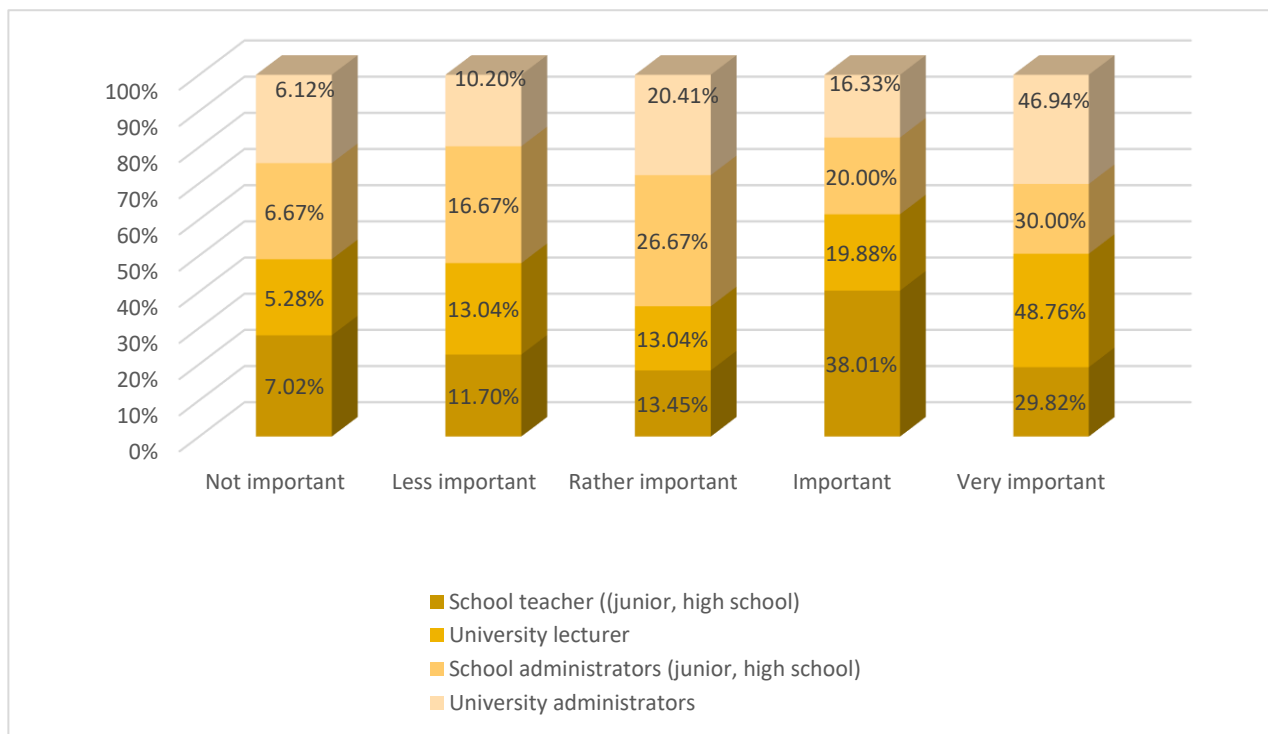

Fig 6. Assess the importance of education and training quality assurance activities in the context of educational innovation according to the working position
(Source of the author's survey. N=572)

Assessing the importance of education and training quality assurance activities in the context of educational innovation according to the working position showed that: The level of assessment by job position is uneven. Specifically, School Teacher ((junior, high school) has the highest "Important" rating, accounting for 38.01%, but the "Not important" rating also accounts for the highest rating of 7.02%. Meanwhile, for university lecturers, the rating "Very important" accounted for the highest rate of 48.76%.

Difficulties and challenges posed by education and training quality assurance activities in the context of educational innovation

To accurately assess the difficulties and challenges posed by education and training quality assurance activities in the context of educational innovation, in addition to macro assessments from state management agencies in education and training; education quality Accreditation; In the study of some colleagues, the research team surveyed N = 572 people. The question is divided into 5 levels with conventional scores (table 2).

Medium score	$1.00 \leq X \leq 1.80$	$1.81 \leq X \leq 2.60$	$2.61 \leq X \leq 3.40$	$3.41 \leq X \leq 4.20$	$4.21 \leq X \leq 5.0$
Convention point	1	2	3	4	5
Convention point	Not important	Less important	Rather important	Important	Very important

Table 2. Table of scale conventions

Processing survey data:

Use the formula to calculate the average score:

$$\bar{X} = \frac{\sum_{i=1}^k X_i K_i}{n}$$

$\bar{X}$: Medium score.

X_i : Score at level i.

K_i : Number of participants rated at X_i level.

n : Number of people participating in the assessment.

Meaning of using " $\bar{X}$ ": The average score in the statistical results represents the degree of representation according to a certain quantity criterion of the sum consisting of many units of the same type. The average score reflects the average level of the phenomenon, and compares two (or more) populations of the studied phenomena of the same type, not of the same scale.

Survey content	Frequency					$\bar{X}$
	Not important	Less important	Rather important	Important	Very important	
Mechanisms and policies on education quality accreditation are still incomplete	5	17	62	298	190	4.14
The capacity of the education quality accreditation service team is still limited	7	21	66	228	250	4.21
Lack of plan to use facilities, equipment, learning materials for education, and educational management to meet output standards	14	18	69	259	212	4.11
The educational management process in educational and training institutions has not been standardized	2	12	59	229	270	4.32
Feedback investigation and monitoring of learners' progress according to output standards have not been carried out regularly	13	22	63	277	197	4.09
Activities to promote the image and training quality of the school are still lacking in synchronicity and science	15	29	82	299	147	3.93
Total						4.14

Table 3. Difficulties and challenges of education and training quality assurance activities in the context of educational innovation (Source of the author's survey. N=572)

The results of the survey on difficulties and challenges posed by education and training quality assurance activities in the context of educational innovation shown in Table 3 show that: "The educational management process in educational and training institutions has not been standardized" is rated as the most important with $\bar{X} = 4.32$. According to some lecturers, teachers, and management teams in some educational and training institutions, "the educational management process in educational and training institutions" plays a very important role in school administration, and activities to ensure the quality of education and training in particular. If the educational management process in the school is scientific and effective, other activities of the school will achieve the set results. If the school management process is unscientific, the school principal pays little attention to educational management activities, then other school activities will not achieve the set goals. In particular, activities to ensure the quality of education will be overlooked.

Also among the surveyed factors, the content "Activities to promote the image and training quality of the school are still lacking in synchronicity and science" was rated the lowest with $\bar{X} = 3.93$ and "Feedback investigation and monitoring of learners' progress according to output standards have not been carried out regularly" is next lowest with $\bar{X} = 4.09$. This is also understandable when many educational and training institutions, for a long time, paid little attention to learners' feedback and promoted the image and educational quality of the school.

However, $\bar{X} = 4.14$, which is in the range of $3.41 \leq \bar{X} \leq 4.20$, is "Important". This problem shows that it is necessary to identify the difficulties and challenges posed by education and training quality assurance activities in the context of educational innovation. education has appropriate measures to improve the quality assurance activities of education and training in the context of educational innovation. It is also an important basis for this study to propose measures to improve education and training quality assurance activities in the context of educational innovation in the coming time.

Proposing measures to improve educational quality assurance activities in the context of educational innovation

Organizing training and retraining to improve the capacity of the team to meet the requirements of education quality assurance:

Objectives: To improve the quality and professional capacity of teachers and staff; leadership and management capacity of school leaders to meet the requirements of education quality assurance.

Content: Organizing training and retraining to raise awareness about quality assurance and educational management in the direction of quality assurance for all school leaders, specialized groups, teachers, and staff in the school. Get it right: quality assurance is a highly unified, responsibility and contribution of everyone in the school, not just the school leadership. Ensuring training quality is doing the right thing at all stages and all educational activities; organizing training and retraining to improve professional capacity for school administrators, teachers, and staff, including improving knowledge, professional skills, moral thought, lifestyle, etc.; the ability to use new technology in education and educational management.

Each officer, teacher, and employee performs two tasks "transferring" knowledge and "education" (in the narrow sense). Therefore, when fostering knowledge, skills, and attitudes of

administrators, teachers, and staff, they must foster knowledge and skills according to educational programs and foster skills in implementing educational programs. sex. In addition to training to improve leadership and management capacity in general for school leaders, it is also necessary to be trained in quality assurance such as the nature of quality assurance, and the contents of quality assurance in education. education and training management towards quality assurance.

Implementation conditions: Each educational institution must develop a training and retraining plan for each year, for a 5-year plan. Plan to train and foster support staff directly involved in the quality assurance process (departments, functional departments, specialized departments, faculties).

The organization invests, exploits, uses facilities, equipment, and learning materials in service of education and educational management to meet output standards:

Objective: To exploit and effectively use facilities, equipment, learning materials, and technology inside and outside the education school, and management and management to meet the output standards of students' ability according to the education program.

Content: Exploiting and effectively using the school's available facilities, equipment, learning materials, and technology in service of education and educational management; Strengthen cooperation to exploit and effectively use facilities, equipment, learning materials, technology, etc. educational services, educational management to develop students' capacity; Organize cooperation, share material resources for education and educational management with other educational institutions.

Implementation conditions: There are plans to invest in the construction of facilities, and purchase equipment to serve the tasks of teaching, experimenting, and scientific research. The plan must show for each year, 5 years. Continuously adding learning materials to serve the educational process

Innovation management of the educational process:

Objectives: Form and develop the right motivation; arouse in learners the need for awareness, actively occupy knowledge in the learning process, form the capacity for autonomy, self-responsibility, and self-management ability...

Content: Organizing and implementing educational programs, regulations, and educational plans of the school; Organizing and managing the development of student learning plans; Organizing and managing the implementation of student learning plans.

Implementation conditions: The close attention of the school management team (Principal, Vice Principals); the participation of specialized faculties and departments; departments and specialized departments in the University and General School.

Organize extracurricular activities to meet the output standards:

Objectives: Enhance study skills, supplement necessary soft skills; foster more styles and attitudes; respect, preserve and promote the fine traditions and national identity and improve the spiritual life of students.

Content: Organizing civic and social responsibility activities for students; Organizing activities to improve understanding of subjects; fostering soft skills, improving spiritual life for students;

GENERAL MANAGEMENT

Organizing activities to raise respect, preserve and promote national identity and other cultural values.

Implementation conditions: There is a cooperation between the University and units and individuals outside the school; the plans for extra-curricular activities of the faculties and specialized departments.

Organize feedback surveys and monitor the progress of learners according to the output standards:

Objective: To evaluate the educational quality of the school against the requirements of the output standards according to the educational program so that the school can adjust the organization of educational activities to meet the requirements of educational quality.

Content: Organize the collection and processing of information of students who complete the educational program according to the output standards, the educational program, and the educational process of the school, the issues that need to be adjusted to the output standards and the program education; Organize the collection and processing of information on students' learning results to meet the requirements of the output standards and the requirements of the society; Organize the collection and processing of information on managers of educational and training units create or employ workers after the student completes the educational program.

Conditions for implementation: The school must establish a system to manage information of students and alumni (address, email, phone number, etc); forming a network of alumni of the University and a system of businesses.

Organize self-assessment and use self-assessment results to ensure and improve the quality of education and training:

Objective: To evaluate the performance of the educational program within the school to make decisions to adjust toward the output standards.

Content: The organization self-recognizes, describes, and clarifies the actual situation of the school; analyze, explain, compare, contrast, and make judgments, point out strengths, shortcomings, and remedial measures; organize the formulation and implementation of plans to improve educational management measures to improve education quality.

Implementation conditions: Participation of educational evaluation organizations; the enthusiastic participation of lecturers, educational support staff, alumni, and students; especially with the participation of businesses, organizations, agencies, and units using "products" trained by the University.

Building and propagating the school's mission, vision, and core values:

Objective: Organize and propagate the mission, vision, and core values of the school to create motivation and consensus in the process of educational implementation toward quality assurance.

Content: Organizing the building of the mission, vision, and core values that create values and make a difference in the school on a legal basis; Directing the propagation of the school's mission, vision, and core values to all school officials, teachers and staff; Directing the dissemination of the school's mission, vision and core values to stakeholders.

Implementation conditions: School leaders are deeply aware of quality assurance, educational management in the direction

of quality assurance; the importance of building and propagating the school's mission, vision, and core values; understanding of building and propagating the school's mission, vision, and core values; understanding of school strategy formulation techn

Conclusion

Globalization is an opportunity, an inevitable trend, taking place in all fields of modern social life: economy, culture, education, etc. direct impact on humans. Therefore, investment in the development of high-quality human resources is an investment in human education, bringing high economic efficiency, and saving the exploitation and use of other resources. Practical experience shows that investment in education and human resource development brings the highest and most stable economic growth. On the other hand, the effectiveness of investment in human development has an equal spread, bringing more equality in development opportunities as well as enjoying the benefits of development. Therefore, investment in education and human development is very necessary today.

Education quality assurance is a stage in education quality management, which is the basis for the implementation of educational goals and programs of each school as well as of each country. To manage the quality of education following educational goals, it is necessary to synchronously implement the internal quality management measures of each school from determining output standards, managing standards input, managing the educational implementation process, and adjusting the educational environment by the standards of the educational program and accordance with the context and practical conditions of each school.
